

Critical infrastructure like power grids and transportation systems are the backbones of our modern lives. Moreover, it is becoming increasingly popular for companies to adopt the concept of industry 4.0 for manufacturing systems as a way to manufacture, improve, and distribute their products. Attacks on critical Infrastructure and manufacturing systems can cause serious consequences for the manufacturers and the whole society. This workshop aims to bring together researchers interested in critical infrastructure and manufacturing systems security (CIMSS) to share fresh ideas. It also intends to foster communications between academia and industry to discuss real-world challenges and creative solutions.

Topics of interest include, but are not limited to:

- New Attack Vectors on CIMSS
- Empirical Study of CIMSS
- Formal Treatment of CIMSS
- Authentication
- Human Factors in CIMSS
- Intrusion/Anomaly Detection/Prevention
- Forensics in CIMSS
- Novel Security Notions for CIMSS

- Cryptographic Tools for CIMSS
- Vulnerabilities Discovery and Management in CIMSS
- Intellectual Property Protection in CIMSS
- Novel Analysis Tools for CIMSS
- Risk Management
- Control Theoretic Methods for CIMSS
- Ransomware in CIMSS

Important Dates

• Submission: March 30, 2023

Notification: April 23, 2023

Workshop Chairs

- Leo Zhang (Deakin University, Australia)
- · ZengPeng Li (Shandong University, China)

- Camera-ready: May 1, 2023
- Workshop dates: TBD During June 19-22, 2023

Publicity Chair

• Chenglu Jin (CWI Amsterdam, The Netherlands)
